

TIDE MANAGER™ STAND-ALONE MOORING SYSTEM

Tide Manager Stand-Alone Mooring System in black

The Tide Manager™ Stand-Alone Mooring System is the perfect solution for mooring your Jet Dock when there is no suitable structure to moor to. The system consists of a pair of 12' poles and machined cubes that the poles go through. The poles are inserted through the cubes and are submerged into the seafloor 2'-3' at the bottom. The poles can then be easily removed if the dock needs to be moved to a new location, or if it needs to be pulled out in the winter to avoid hard ice flows. The system can also accommodate up to four feet of water level fluctuation.
